<p style="text-align:center">Debugging assignment</p>

Snippet 1

Problem:

The code tried to add a string and a number:

a = "Hello" + 1

This caused an error because Python cannot combine text and numbers.

Fix:

Changed it to:

a = "Hello" + "1"

Also added db.close() at the end to properly close the file.

Result:

The program now works and creates output.txt with this line:

Hello1, How do you do?

Snippet 2

Problem:

The code had missing punctuation and wrong indentation:

for i in a

print(sum(i)*2

- Missing colon (:) after the for loop
- The print line was not indented

Fix:

Added the colon and indented the print statement:

def findTotal(a):

for i in a:

print(sum(i) * 2)

Also added an example list to test the function.

Result:

The program now works and prints the doubled sums of lists:

12

30

Conclusion:

Both snippets are now fixed.

- Snippet 1 creates the output file correctly.
- Snippet 2 prints the correct results.
